Gercicio 3. Equación legistica dy(t) = 2y(1-y) para 0< t< max Condición incide yo: Población micral, 2>0 y Tu Salecián Exacta: y(t) = yo + (1-yo)e, t Aproximar el crazimiando de la pobleción usando al medode forward Euler.

(a) Escribir la formula del médodo para este caso e implomantarlo en Python. fórmula yn+1 = yn + ntf(tn,yn) para n=0, 12,..., Nt-1 Ynt1= yn + ht 2y(1-y) Susdidyando In-1 = yntht(2y-2/2) Int = yn + htlyn - htlyn Jn+1= (1+hex)yn-htzyn Y1 = Ayo - htayo A=(1+hez)

- B) Reproducir la gráfica que se muestra en la siguiente lámina para  $\lambda=10,\ y_0=0.001,\ T_{max}=1\ y\ N_t=4,16,64$ 
  - Programación en Python
